**Sides and Angles of Parallelograms** A quadrilateral with both pairs of opposite sides parallel is a **parallelogram**. Here are four important properties of parallelograms.

|  | If PQRS is a parallelogram, then  |
|--|---|
| The opposite sides of a parallelogram are congruent.                   | $\overline{PQ} \cong \overline{SR}$ and $\overline{PS} \cong \overline{QR}$   |
| The opposite angles of a parallelogram are congruent.                  | $\angle P \cong \angle R$ and $\angle S \cong \angle Q$   |
| The consecutive angles of a parallelogram are supplementary.           | $\angle P$ and $\angle S$ are supplementary; $\angle S$ and $\angle R$ are supplementary; $\angle R$ and $\angle Q$ are supplementary; $\angle Q$ and $\angle P$ are supplementary. |
| If a parallelogram has one right angle, then it has four right angles. | If $m\angle P = 90$ , then $m\angle Q = 90$ , $m\angle R = 90$ , and $m\angle S = 90$ .   |

**Diagonals of Parallelograms** Two important properties of parallelograms deal with their diagonals.

|   | If ABCD is a parallelogram, then:   |
|---|---|
| The diagonals of a parallelogram bisect each other.                   | $AP = PC$ and $DP = PB$   |
| Each diagonal separates a parallelogram into two congruent triangles. | $\triangle ACD \cong \triangle CAB$ and $\triangle ADB \cong \triangle CBD$ |

## Example

If ABCD is a parallelogram, find  $a$  and  $b$ .

$\overline{AB}$  and  $\overline{CD}$  are opposite sides, so  $\overline{AB} \cong \overline{CD}$ .

$$2a = 34$$

$$a = 17$$

$\angle A$  and  $\angle C$  are opposite angles, so  $\angle A \cong \angle C$ .

$$8b = 112$$

$$b = 14$$

## Example

Find  $x$  and  $y$  in parallelogram ABCD.

The diagonals bisect each other, so  $AE = CE$  and  $DE = BE$ .

$$6x = 24$$

$$4y = 18$$

$$x = 4$$

$$y = 4.5$$

**Conditions for a Parallelogram** There are many ways to establish that a quadrilateral is a parallelogram.

| If:   | If:  |
|---|--|
| both pairs of opposite sides are parallel,            | $\overline{AB} \parallel \overline{DC}$ and $\overline{AD} \parallel \overline{BC}$ ,  |
| both pairs of opposite sides are congruent,           | $\overline{AB} \cong \overline{DC}$ and $\overline{AD} \cong \overline{BC}$ ,  |
| both pairs of opposite angles are congruent,          | $\angle ABC \cong \angle ADC$ and $\angle DAB \cong \angle BCD$ ,  |
| the diagonals bisect each other,                      | $\overline{AE} \cong \overline{CE}$ and $\overline{DE} \cong \overline{BE}$ ,  |
| one pair of opposite sides is congruent and parallel, | $\overline{AB} \parallel \overline{CD}$ and $\overline{AB} \cong \overline{CD}$ , or $\overline{AD} \parallel \overline{BC}$ and $\overline{AD} \cong \overline{BC}$ , |
| then: the figure is a parallelogram.                  | then: $ABCD$ is a parallelogram.   |

# Rectangles

**Properties of Rectangles** A rectangle is a quadrilateral with four right angles. Here are the properties of rectangles.

A rectangle has all the properties of a parallelogram.

- Opposite sides are parallel.

# Rhombi and Squares

**Properties of Rhombi** A rhombus is a quadrilateral with four congruent sides. Opposite sides are congruent, so a rhombus is also a parallelogram and has all of the properties of a parallelogram. Rhombi also have the following properties.

|  |  |
|--|--|
| The diagonals are perpendicular.   | $\overline{MH} \perp \overline{RO}$  |
| Each diagonal bisects a pair of opposite angles.                                     | $\overline{MH}$ bisects $\angle RMO$ and $\angle RHO$ .<br>$\overline{RO}$ bisects $\angle MRH$ and $\angle MOH$ . |
| If the diagonals of a parallelogram are perpendicular, then the figure is a rhombus. | If $RHOM$ is a parallelogram and $\overline{RO} \perp \overline{MH}$ , then $RHOM$ is a rhombus.                   |

**Example** In rhombus  $ABCD$ ,  $m\angle BAC = 32$ . Find the measure of each numbered angle.

$ABCD$  is a rhombus, so the diagonals are perpendicular and  $\triangle ABE$  is a right triangle. Thus  $m\angle 4 = 90$  and  $m\angle 1 = 90 - 32$  or  $58$ . The diagonals in a rhombus bisect the vertex angles, so  $m\angle 1 = m\angle 2$ . Thus,  $m\angle 2 = 58$ .

A rhombus is a parallelogram, so the opposite sides are parallel.  $\angle BAC$  and  $\angle 3$  are alternate interior angles for parallel lines, so  $m\angle 3 = 32$ .

**Properties of Squares** A square has all the properties of a rhombus and all the properties of a rectangle.

**Example** Find the measure of each numbered angle of square  $ABCD$ .

Using properties of rhombi and rectangles, the diagonals are perpendicular and congruent.  $\triangle ABE$  is a right triangle, so  $m\angle 1 = m\angle 2 = 90$ .

Each vertex angle is a right angle and the diagonals bisect the vertex angles, so  $m\angle 3 = m\angle 4 = m\angle 5 = 45$ .

# 8-6 Study Guide and Intervention

## Trapezoids

**Properties of Trapezoids** A trapezoid is a quadrilateral with exactly one pair of parallel sides. The parallel sides are called **bases** and the nonparallel sides are called **legs**. If the legs are congruent, the trapezoid is an **isosceles trapezoid**. In an isosceles trapezoid both pairs of **base angles** are congruent.

$STUR$  is an isosceles trapezoid.  
 $\overline{SR} \cong \overline{TU}$ ;  $\angle R \cong \angle U$ ,  $\angle S \cong \angle T$

**Medians of Trapezoids** The **median** of a trapezoid is the segment that joins the midpoints of the legs. It is parallel to the bases, and its length is one-half the sum of the lengths of the bases.

In trapezoid  $HJKL$ ,  $MN = \frac{1}{2}(HJ + LK)$ .

**Example**  $\overline{MN}$  is the median of trapezoid  $RSTU$ . Find  $x$ .

$$MN = \frac{1}{2}(RS + UT)$$

$$30 = \frac{1}{2}(3x + 5 + 9x - 5)$$

$$30 = \frac{1}{2}(12x)$$

$$30 = 6x$$

$$5 = x$$
